

SQL Full Outer Join

Last update on November 09 2019 06:55:13 (UTC/GMT +8 hours)

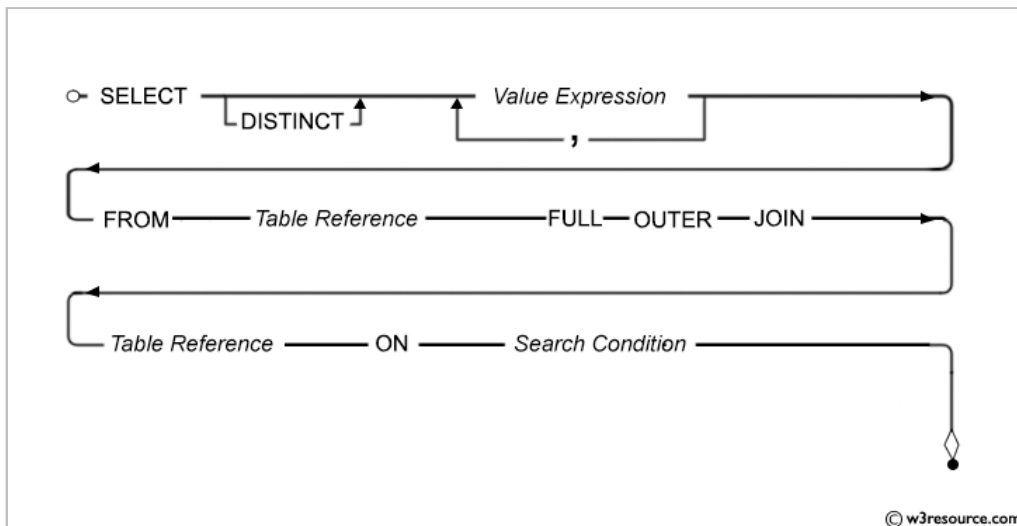

What is Full Outer Join in SQL?

In SQL the FULL OUTER JOIN combines the results of both [left](#) and [right](#) outer joins and returns all (matched or unmatched) rows from the tables on both sides of the join clause.

Syntax:

```
SELECT *
FROM table1
FULL OUTER JOIN table2
ON table1.column_name=table2.column_name;
```

Syntax diagram - FULL OUTER JOIN

Example: SQL FULL OUTER JOIN

Let's combine the same two tables using a full join.

table_A		table_B	
A	M	A	N
1	m	2	p
2	n	3	q
4	o	5	r

SQL Code:

```
SELECT * FROM table_A
FULL OUTER JOIN table_B
ON table_A.A=table_B.A;
```

Output:

A	M	A	N
2	n	2	p
1	m	-	-
4	o	-	-
-	-	3	q
-	-	5	r

Because this is a full join, all rows (both matching and nonmatching) from both tables are included in the output. There is only one match between table table_A and table table_B, so **only one row of output displays values in all columns**. All remaining rows of output contain only values from table table_A or table table_B, with the remaining columns set to missing values

only one row of output displays values in all columns explain below -

A	M	A	N
2	n	2	p
1	m	-	-
4	o	-	-
-	-	3	q
-	-	5	r

Pictorial Presentation: SQL FULL OUTER JOIN

A	M
1	m
2	n
4	o

table_A

**SELECT * FROM table_A
FULL OUTER JOIN table_B
ON table_A.A=table_B.A;**

A	N
2	p
3	q
5	r

table_B

A	M	A	N
2	n	2	p
1	m	-	-
4	o	-	-
-	-	3	q
-	-	5	r

Output

Example: SQL FULL OUTER JOIN between two tables

Here is an example of full outer join in SQL between two tables.

Sample table: foods

Sample table: company

As we know the FULL OUTER JOIN is the combination of the results of both LEFT OUTER JOIN and RIGHT OUTER JOIN, so, here we are going to describe how FULL OUTER JOIN perform internally.

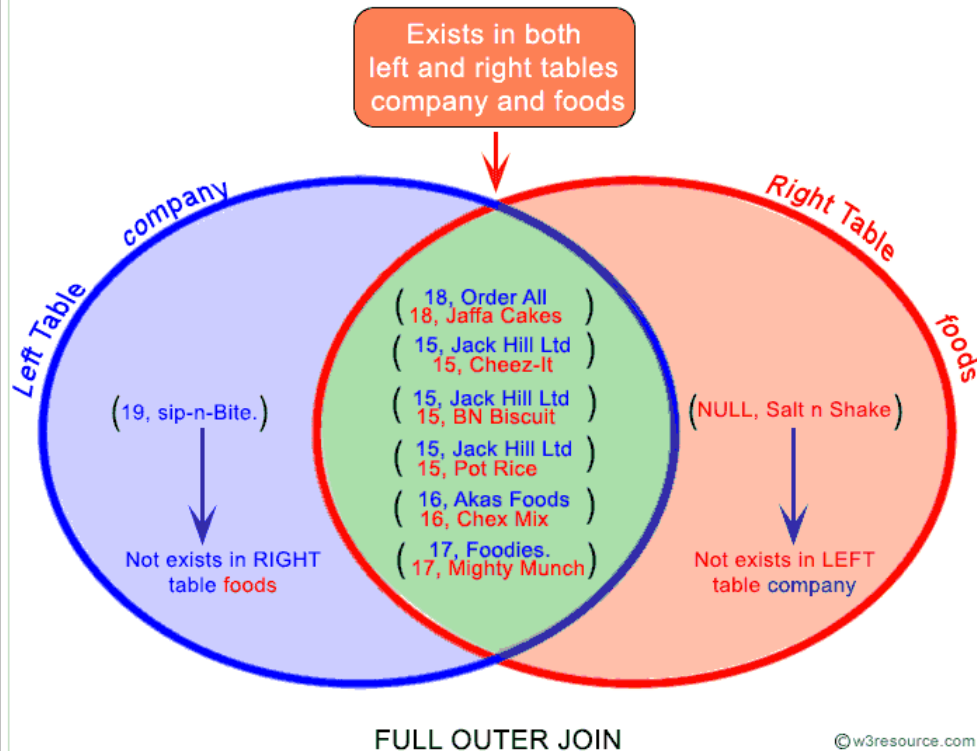

Pictorial Presentation:

```
SELECT a.company_id as "a.ComID",
a.company_name as "C_Name",
b.company_id as "b.ComID"
FROM company a
LEFT OUTER JOIN foods b
ON a.company_id = b.company_id;
```

A.ComID	C_Name	B.ComID
16	Akas Foods	16
15	Jack Hill Ltd	15
15	Jack Hill Ltd	15
17	Foodies.	17
15	Jack Hill Ltd	15
18	Order All	18
19	sip-n-Bite.	-

```
SELECT a.company_id as "a.ComID",
a.company_name as "C_name",
b.company_id as "b.ComID"
FROM company a
RIGHT OUTER JOIN foods b
ON a.company_id = b.company_id;
```

A.ComID	C_name	B.ComID
16	Akas Foods	16
15	Jack Hill Ltd	15
15	Jack Hill Ltd	15
17	Foodies.	17
15	Jack Hill Ltd	15
18	Order All	18
-	-	-

Here is the SQL statement which returns all rows from the 'foods' table and 'company' table using "FULL OUTER JOIN" clause.

SQL Code:

```
SELECT a.company_id AS "a.ComID",
a.company_name AS "C_Name",
b.company_id AS "b.ComID",
b.item_name AS "I_Name"
FROM company a
FULL OUTER JOIN foods b
ON a.company_id = b.company_id;
```

Output:

a.ComID	C_Name	b.ComID	I_Name
16	Akas Foods	16	Chex Mix
15	Jack Hill Ltd	15	Cheez-It
15	Jack Hill Ltd	15	BN Biscuit
17	Foodies.	17	Mighty Munch
15	Jack Hill Ltd	15	Pot Rice
18	Order All	18	Jaffa Cakes
			Salt n Shake
19	sip-n-Bite.		

FULL OUTER JOIN using WHERE clause

We can include a WHERE clause with a FULL OUTER JOIN to get return only those rows where no matching data between the joining tables are exist.

The following query returns only those company that have no matching food product in foods, as well as that food product in foods that are not matched to the listed company.

```
SELECT a.company_id AS "a.ComID",
a.company_name AS "C_Name",
b.company_id AS "b.ComID",
b.item_name AS "I_Name"
FROM   company a
FULL OUTER JOIN foods b
ON a.company_id = b.company_id
WHERE a.company_id IS NULL
OR b.company_id IS NULL
ORDER BY company_name;
```

Output:

a.ComID	C_Name	b.ComID	I_Name
19	sip-n-Bite.		
			Salt n Shake

FULL OUTER JOIN using UNION clause

A UNION clause can be used as an alternate to get the same result as FULL OUTER JOIN

Here is the example:

table_A	table_B																
<table> <tr><th>A</th><th>M</th></tr> <tr><td>1</td><td>m</td></tr> <tr><td>2</td><td>n</td></tr> <tr><td>4</td><td>o</td></tr> </table>	A	M	1	m	2	n	4	o	<table> <tr><th>A</th><th>N</th></tr> <tr><td>2</td><td>p</td></tr> <tr><td>3</td><td>q</td></tr> <tr><td>5</td><td>r</td></tr> </table>	A	N	2	p	3	q	5	r
A	M																
1	m																
2	n																
4	o																
A	N																
2	p																
3	q																
5	r																

Here is the SQL statement:

```
SELECT table_a.A,table_a.M,table_b.A,table_b.N
FROM table_A
FULL OUTER JOIN table_B
ON table_A.a=table_b.A
ORDER BY table_A.A;
```

FULL OUTER JOIN using LEFT and RIGHT OUTER JOIN and UNION clause

The following code is, the combination of LEFT OUTER JOIN and RIGHT OUTER JOIN and combined by, using UNION clause

```
SELECT table_a.A,table_a.M,table_b.A,table_b.N
FROM table_A
LEFT OUTER JOIN table_B
ON table_A.a=table_b.A
UNION
SELECT table_a.A,table_a.M,table_b.A,table_b.N
FROM table_A
RIGHT OUTER JOIN table_B
ON table_A.a=table_b.A;
```

Output:

A	M	A	N
1	m	-	-
2	n	2	p
4	o	-	-
-	-	3	q
-	-	5	r

Note: Outputs of the said SQL statement shown here is taken by using Oracle Database 10g Express Edition.
